My mathematical journey

Lia Vaš Saint Joseph's University, Philadelphia, USA

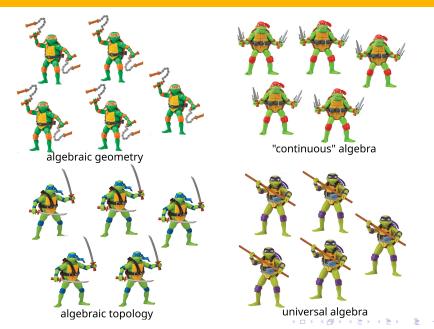

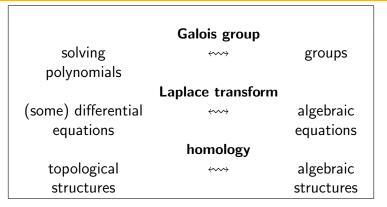

Modern mathematics...

And then there are also mutants...

Some bridges were built ...

So, building bridges seemed important...

... and I ended up working on one of them.

Operator theory

(or at least on one lane of the multi-lane highway of this bridge)

(日)

But, let me start from my roots...

Serbia

... and travelling.

Gonzalo Aranda Pino

got me closer to algebras defined over graphs called
Leavitt path algebras

Graph algebras

Damsel in distress: a **graph** C*-**algebra** Knight in shining armour: a **Leavitt path algebra**. The examples of C^* -algebras were so vast and so diverse, that a need for their **classification** became evident.

This initiative is known as the

Elliott Classification Program.

Elliott completely classified one type of C^* -algebras (the "best behaved" type).

Graphs and paths

Start with a directed graph: vertices, edges, and source and

range map, s and r.

For example, the paths of

$$\bullet^u \xrightarrow{e} \bullet^v \xrightarrow{f} \bullet^w$$

are

u, v, w (length 0), e, f (length 1) and ef (length 2).

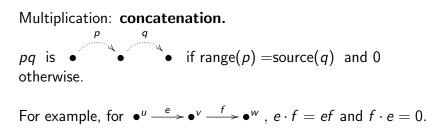

(日) (四) (日) (日) (日)

Adding and multiplying paths – path algebra

Addition: a new element p + q.

Form a vector space over your favorite coefficient field with the paths as the *basis*. This is the **path algebra**.

For example, some elements of the path algebra over our example graph: $3e + \sqrt{5} ef$, and $2v - \frac{3}{4}f$.

Example $\bullet^{u} \xrightarrow{e} \bullet^{v} \xrightarrow{f} \bullet^{w}$ continued

The standard matrix units:
$$e_{11} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$
,

$$e_{12} = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$
 etc.

The map

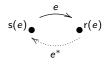

$$u\mapsto e_{11}, \ e\mapsto e_{12}, \ ef\mapsto e_{13}, \ v\mapsto e_{22}, \ f\mapsto e_{23},$$
 and
 $w\mapsto e_{33}$

extends to an isomorphism of the path algebra and the algebra of the **upper triangular matrices**. We represent this iso by

$$\left[\begin{array}{ccc} u & e & ef \\ 0 & v & f \\ 0 & 0 & w \end{array}\right]$$

To get to a C^* -algebra we need to have an involution (glorified transpose).

Add the **ghost edges** – elements of the form e^* for $e \in E^1$.

The vertices are **selfadjoint:** $v^* = v$ for $v \in E^0$.

Example 1 – Matrices

Generalizes to n-line.

Path algebra: upper triangular *n*×*n* matrices **Leavitt path algebra:** all *n*×*n* matrices

Graph C*-algebra: all *n*x*n* matrices but considered with the norm.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Paths: $v = 1 = e^0, e = e^1, e^2, e^3, \dots$ Representation: e = x

Path algebra: Polynomials with coefficients in *K*. Think that $3v + 5e^2 \iff 3 + 5x^2$.

Ghost edge e^* . Representation: $e^* = x^{-1}$

Leavitt path algebra: Laurent polynomials (like regular polynomials but with negative powers of x also). For example, $2e^* + 3v + 5e^2 \iff 2x^{-1} + 3 + 5x^2$.

Graph C*-algebra: continuous functions on a circle $C(S^1)$.

 $e \bigoplus e^{V} \oint f$

two-petal rose

Leavitt path algebra is known as the Leavitt algebra L(1,2). It is a universal example of a ring R with $R^2 \cong R$.

Graph C*-algebra: Cuntz algebra \mathcal{O}_2 .

Generalizes to n-rose.

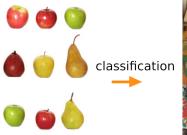

Some research trends

1. Characterizations. For a given algebra property P, find a graph property Q so that $L_{\mathcal{K}}(E)$ has P iff E has Q.

2. Generalizations. For example, generalize the class of graphs.

3. Classifications. For example, are $L_{\mathcal{K}}(E) \cong L_{\mathcal{K}}(F)$ as algebras \Leftrightarrow the Grothendieck groups are isomorphic?

Dimensions of vector spaces: 1, 2, 3...

One would want these dimensions to form a group, the

group of dimensions.

So, we "add" zero and inverses

 $\ldots,\,-3,\,-2,\,-1,\,0,\,1,\,2,\,3,\,\ldots$

And this is it: the zero Grothendieck group (of the underlying coefficient field) is the group of integers \mathbb{Z} .

Grothendieck groups of graph algebras are graded

(additional structure coming from the lengths of the paths).

Graded Classification Conjecture.

 $L_{\mathcal{K}}(E) \cong L_{\mathcal{K}}(F)$ are isomorphic as graded algebras \Leftrightarrow their graded Grothendieck groups are (pointed) isomorphic.

Asked by **Roozbeh Hazrat** in 2011.
